ABSTRACT. In this paper, we introduce the concept of kp-semisimple part in *BCI*-algebras and give some characterization of such algebras

1. Introduction and Preliminaries

A *BCI*-algebra is an algebra $(X, *, 0)$ of type $(2, 0)$ with the following conditions:

- (1) $((x * y) * (x * z)) * (z * y) = 0$
- (2) $(x * (x * y)) * y = 0$
- (3) $x * x = 0$
- (4) $x * y = y * x = 0$ implies $x = y$.

A partial ordering \leq on X can be defined by $x \leq y$ if and only if $x * y = 0$.

The following identities hold for any *BCI*-algebra X :

- (1) $x * 0 = x$,
- (2) $(x * y^k) * z^k = (x * z^k) * y^k$,
- (3) $0 * (x * y)^k = (0 * x^k) * (0 * y^k)$,
- (4) $0 * (0 * x)^k = 0 * (0 * x^k)$,

where k is any positive integer.

A nonempty subset I of a *BCI*-algebra X is called an ideal if $0 \in I$ and if $x * y, y \in I$ then $x \in I$. For any *BCI*-algebra X , the set $P(X) = \{x \mid 0 * x = 0\}$ is called the *BCK*-part of X . If $P(X) = 0$, then we say that X is a p-semisimple *BCI*-algebra.

Definition 1.1([1]). A nonempty subset I of a *BCI*-algebra X is called a k -ideal of X if

- (1) $0 \in I$
- (2) $x * y^k \in I$ and $y \in I$ imply $x \in I$.

Definition 1.2. Let X be a *BCI*-algebra and k a positive integer, we define

$$SP_k(X) = \{x \in X \mid 0 * (0 * x)^k = x\}$$

We say that $SP_k(X)$ is the kp-semisimple part of X . In particular, if $k = 1$, the $SP(X)$ is called the p-semisimple part of X ([2])

Proposition 1.3. $SP_k(X) \cap P(X) = 0$

Proof. If $x \in SP_k(X) \cap P(X)$, then $0 * x = 0$ and $0 * (0 * x)^k = x$. Hence $x = 0$ and that $SP_k(X) \cap P(X) = 0$.

Proposition 1.4. For any *BCI*-algebra X , $SP_k(X)$ is a subalgebra of X .

Key words and phrases. kp-semisimple part, *BCK*-part, k -ideal.

Proof. Let $x, y \in SP_k(X)$, then $0 * (0 * x)^k = x$ and $0 * (0 * y)^k = y$.

$$0 * (0 * (x * y)^k) = 0 * (0 * (x * y)^k) = (0 * (0 * x^k)) * (0 * (0 * y^k)) = x * y$$

Hence $x * y \in SP_k(X)$.

2. Main Results

Theorem 2.1. For any *BCI*-algebra X . $SP_k(X)$ is a k -ideal if and only if for $x, y \in P(X)$ and $u, v \in SP_k(X)$, then $x * u^k = y * u^k$ implies $x = y$ and $u = v$.

Proof. If $SP_k(X)$ is a k -ideal of X and $x * u^k = y * v^k$ for any $x, y \in P(X)$ and $u, v \in SP_k(X)$, then $0 * (x * u^k) = 0 * (y * v^k)$ and thus $(0 * x) * (0 * u^k) = (0 * y) * (0 * v^k)$. Hence $0 * (0 * u^k) = 0 * (0 * v^k)$ since $x, y \in P(X)$. It follows that $u = v$ since $u, v \in SP_k(X)$. From this, we have $x * u^k = y * u^k$ and thus $(x * y) * u^k = (x * u^k) * y = (y * u^k) * y = (y * y) * u^k = 0 * u^k \in SP_k(X)$ by proposition 1.4. Hence $x * y \in SP_k(X)$ since $SP_k(X)$ is a k -ideal. Therefore $x * y = 0$ since $x * y \in SP_k(X) \cap P(X)$. Similarly, we have $y * x = 0$ and thus $x = y$.

Conversely, if $y, x * y^k \in SP_k(X)$, then

$$\begin{aligned} x * y^k &= 0 * (0 * (x * y^k)^k) = 0 * ((0 * x^k) * (0 * y^k)^k) = 0 * ((0 * x^k) * (0 * y^k)^k) = \\ &= (0 * (0 * x^k)) * (0 * (0 * y^k)^k) = (0 * (0 * x^k)) * y^k \end{aligned}$$

By hypothesis, $x = 0 * (0 * x^k)$. Hence $x \in SP_k(X)$ and consequently $SP_k(X)$ is a k -ideal of X .

For any *BCI*-algebra X and any element a in X , we use a_r^k denote the k -selfmap of X defined by $a_r^k(x) = x * a^k$.

Theorem 2.2. For any *BCI*-algebra X , then $SP_k(X)$ is a k -ideal of X if and only if a_r^k is bijective for any $SP_k(X)$.

Proof. At first we assume that $SP_k(X)$ is a k -ideal of X and $a \in SP_k(X)$. If $a_r^k(x) = a_r^k(y)$, then $x * a^k = y * a^k$ for any $x, y \in X$. $(x * y) * a^k = (x * a^k) * y = (y * a^k) * y = 0 * a^k \in SP_k(X)$. From this it follows that $x * y \in SP_k(X)$ since $SP_k(X)$ is a k -ideal of X , and $a = 0 * (0 * a^k) = (0 * (x * y)^k) * (0 * a^k) = (0 * (0 * a^k)) * (x * y)^k = a * (x * y)^k$

In particular, $0 * (x * y)^k = 0$, and thus $x * y = 0 * (0 * (x * y)^k) = 0$.

Similarly, we have $y * x = 0$, Therefore $x = y$ Hence a_r^k is injective. On the other hand, for any

$$\begin{aligned} x \in X, & ((x * a^k) * (0 * a)) * x = ((x * a^k) * x) * (0 * a) = \\ & (0 * a^k) * (0 * a) = 0 * a^{k-1} = a * a^k = (0 * (0 * a^k)) * a^k = 0 \text{ and} \\ & (0 * a)_r^k a_r^k(x * ((x * a^k) * (0 * a))) = ((x * ((x * a^k) * (0 * a))) * a^k) * (0 * a)^k = \\ & ((x * ((x * a^k) * (0 * a))) * a^k) * (0 * a)^k = ((x * a^k) * (0 * a)^k) * (0 * a)^k = \\ & ((x * a^k) * (0 * a)^k) * ((x * a^k) * (0 * a)) = 0 * (0 * a)^{k-1} = (0 * a) * (0 * a)^k = \\ & (0 * (0 * a)^k) * a = a * a = 0 = (0 * a^k) * (0 * a^k) = (0 * (0 * a^k)) * a^k = (0 * a)_r^k a_r^k \end{aligned}$$

Since $(0 * a)_r^k$ and a_r^k are injective, we have

$$x * ((x * a^k) * (0 * a)) = 0$$

Hence $x = (x * a^k) * (0 * a) = (x * (0 * a)) * a^k = a_r^k(x * (0 * a))$

Therefore a_r^k is surjective.

Conversely if a_r^k is bijective for any $a \in SP_k(X)$, then $SP_k(X)$ is a k -ideal of X by Theorem 2.1.

From the proof of Theorem 2.1, it's easy to see that $(0 * a)_r^k$ is the inverse of a_r^k .

Theorem 2.3. Let X be a BCI-algebra. If $SP_k(X)$ is a k-ideal of X , then $a_r^k b_r^k = (a * (0 * b^k))_r^k$ for any $a, b \in SP_k(X)$.

Proof. For any $x \in X$. $(a * (0 * b^k))_r^k (((x * b^k) * a^k) * (x * (a * (0 * b^k))_r^k)) = (((x * b^k) * a^k) * (x * (a * (0 * b^k))_r^k)) * (a * (0 * b^k))_r^k = (0 * b^k) * a^k = 0 * (a * (0 * b^k))_r^k = (a * (0 * b^k))_r^k (0)$ and $a_r^k b_r^k (((x * (a * (0 * b^k))_r^k) * ((x * b^k) * a^k)) = (((x * (a * (0 * b^k))_r^k) * ((x * b^k) * a^k)) * a^k = 0 * (a * (0 * b^k))_r^k = (0 * a^k) * (0 * (0 * b^k))_r^k = (0 * a^k) * b^k = a_r^k b_r^k (0)$

Since $(a * (0 * b^k))_r^k$ and $a_r^k b_r^k$ are injective, we have $((x * b^k) * a^k) * (x * (a * (0 * b^k))_r^k) = 0$ and $(x * (a * (0 * b^k))_r^k) * ((x * b^k) * a^k) = 0$. Hence $x * (a * (0 * b^k))_r^k = (x * b^k) * a^k$ and that $a_r^k b_r^k(x) = (a * (0 * b^k))_r^k(x)$ for any $x \in X$. Hence $a_r^k b_r^k = (a * (0 * b^k))_r^k$.
